

# **Lesson 7: No Bending or Stretching**

Let's compare measurements before and after translations, rotations, and reflections.

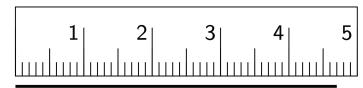

### 7.1: Measuring Segments

For each question, the unit is represented by the large tick marks with whole numbers.

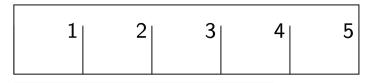

1. Find the length of this segment to the nearest  $\frac{1}{8}$  of a unit.

2. Find the length of this segment to the nearest 0.1 of a unit.

3. Estimate the length of this segment to the nearest  $\frac{1}{8}$  of a unit.

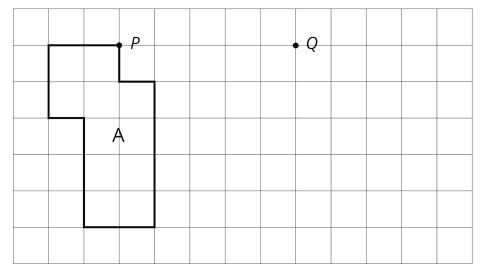

4. Estimate the length of the segment in the prior question to the nearest 0.1 of a unit.

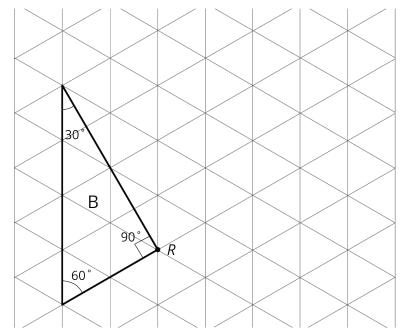

## 7.2: Sides and Angles

1. Translate Polygon A so point P goes to point Q. In the image, write the length of each side, in grid units, next to the side.

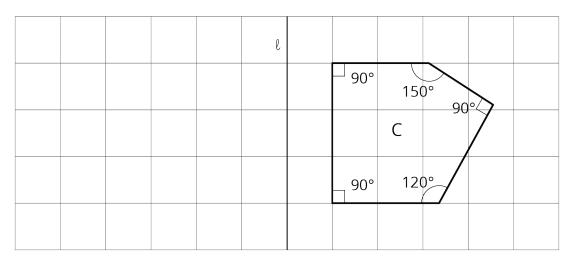

2. Rotate Triangle B 90 degrees clockwise using R as the center of rotation. In the image, write the measure of each angle in its interior.

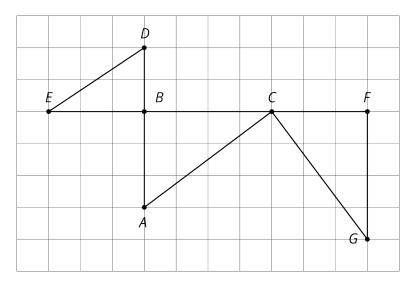

- 3. Reflect Pentagon C across line  $\ell$ .
  - a. In the image, write the length of each side, in grid units, next to the side. You may need to make your own ruler with tracing paper or a blank index card.
  - b. In the image, write the measure of each angle in the interior.

#### 7.3: Which One?

Here is a grid showing triangle ABC and two other triangles.

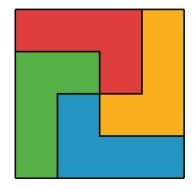

You can use a **rigid transformation** to take triangle ABC to *one* of the other triangles.

- 1. Which one? Explain how you know.
- 2. Describe a rigid transformation that takes ABC to the triangle you selected.

#### Are you ready for more?

A square is made up of an L-shaped region and three transformations of the region. If the perimeter of the square is 40 units, what is the perimeter of each L-shaped region?

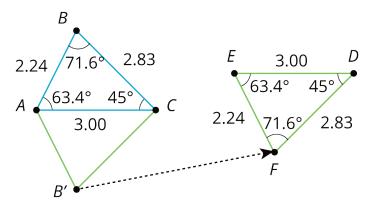

#### **Lesson 7 Summary**

The transformations we've learned about so far, translations, rotations, reflections, and sequences of these motions, are all examples of **rigid transformations**. A rigid transformation is a move that doesn't change measurements on any figure.

Earlier, we learned that a figure and its image have corresponding points. With a rigid transformation, figures like polygons also have **corresponding** sides and corresponding angles. These corresponding parts have the same measurements.

For example, triangle EFD was made by reflecting triangle ABC across a horizontal line, then translating. Corresponding sides have the same lengths, and corresponding angles have the same measures.

measurements in triangle $ABC$	corresponding measurements in image $EFD$
AB = 2.24	EF = 2.24
BC = 2.83	FD = 2.83
CA = 3.00	DE = 3.00
$m \angle ABC = 71.6^{\circ}$	<i>m</i> ∠ <i>EFD</i> = 71.6°
$m \angle BCA = 45.0^{\circ}$	$m \angle FDE = 45.0^{\circ}$
$m \angle CAB = 63.4^{\circ}$	$m \angle DEF = 63.4^{\circ}$
